

Cycles :Nakshatara 28 days. Moon and Nodes approx 28 dy. Merc 87 dy. Venus 224 dy. Mars 686 dy. Jupiter 4328d, Saturn 10738d, Uranus 30565d, Neptune 59957d. Cycle time in days are indicative but software will be precise. As an example if Moon, Node and Mars calculated position is in Aswin 0- 12.8 deg. band we can anticipate a disruptive event. If Uranus and Neptune too is present there can be catastrophic events in the making. But the predicting researchers should confirm such events from records through assiduous search and only then it can be predictable. The precession of the equinoxes will change Aswini position to 0 degrees in about 920 years thereby shifting the column upwards. Hence validation from recorded events will make the prediction accurate. The system can be made as accurate as one wants. Dividing each 12.8 by 9 and again by 7 or $1/63^{\text{rd}}$ fraction can even confirm if a phone call come through!!!.
